# Setting up a VUZIX Blade profile in Android Studio
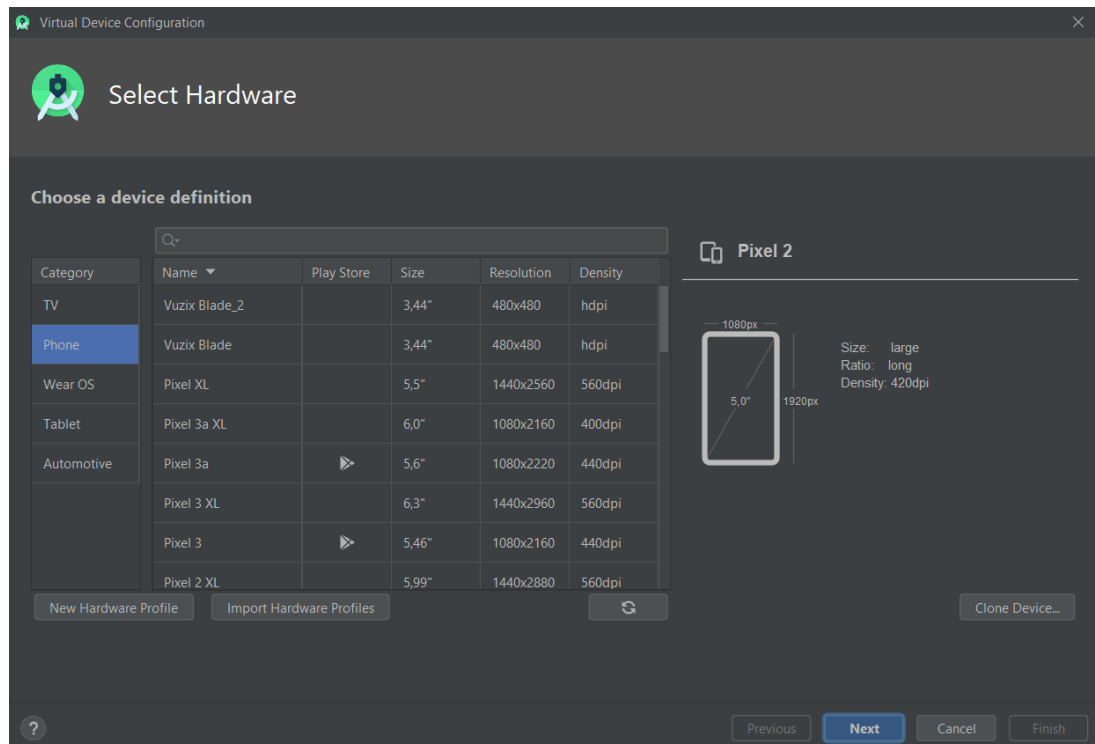

After creating a new project in Android Studio open the "AVD Manager".

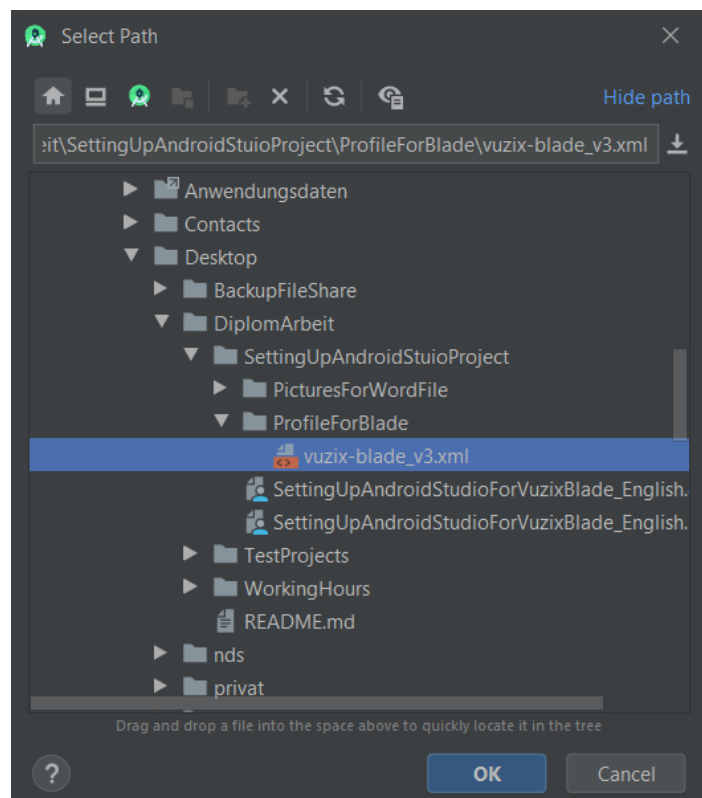

In the pop-up-window select "Create Virtual Device".

The next step is to import the Import the profile. First click "Import Hardware Profiles".

Then find and select the profile file of your VUZIX Blade "vuzix-blade_v3.xml". Select the file and press okay.

Then the little window should close itself. Press "Next". In the next window press "cancel". This is cancelled, because the VUZIX Blade has a specific hardware, which can not be emulated by Android Studio. So, the Profile for the VUZIX Blade is created, but no simulated hardware is added. The Profile is important for the layout of the program later.
